What's New in the NET Disassembler?

NET Disassembler (netdisasm.exe) is a command line disassembler for the .NET Framework 4.0 (optional components are included in the package as .NET Framework 2.0). Disassembling with NET Disassembler works almost identically to disassembling with IL Disassembler, except that NET Disassembler returns the disassembled code in "C#", and not IL. NET Disassembler is a command line utility, and it uses the .NET Framework's implementation of CodeDom. NET Disassembler will not disassemble invalid or unsupported assemblies. You have to make sure that your assemblies are valid, supported assemblies, before you start disassembling with NET Disassembler. NET Disassembler disassembles .NET Framework assemblies created using the IL Disassembler. The IL Disassembler is part of the Microsoft Framework SDK. .NET Disassembler can also disassemble .NET Framework libraries (.NET Framework application or library that are developed using Microsoft's .NET Framework SDK for libraries). NET Disassembler can't disassemble non-managed assemblies such as C++, or assemblies that are compiled for different versions of the .NET Framework. For more information about .NET Disassembler, see the article: Let's have a look at the different ways this application can be used: First, you can obtain the source code for any file type that is developed with the .NET framework, and this source code can then be processed with NET Disassembler. To do so, select the file you want to disassemble from the Open menu, as shown below: After saving the file in the location you want, you can use the Save function in order to generate a text document containing the disassembled code, as seen in the following screenshot: Next, you can export all the disassembled code to a text file
